

## Powers to the Numbers

In each row, write the problems in exponent form. Then, find the value. You may use a calculator to check your answers.

1. five squared

$8 \cdot 8 \cdot 8 \cdot 8$

nine to the 4th power

## Exponents

An **exponent** tells the number of times a number is used as a factor.

$$4^3 = 4 \times 4 \times 4 \text{ or } 64$$

4 is the **base**, and 3 is the **exponent**.

Rewrite each power in factored form and simplify.

1.  $6^3 = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$       4.  $1^5 = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$

2.  $2^5 = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$       5.  $9^3 = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$

3.  $3^4 = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$       6.  $4^4 = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$

7. What does 1 raised to any power equal? Why? \_\_\_\_\_

8. Why does  $3^4$  equal  $9^2$ ? \_\_\_\_\_

Solve these three sets of problems. Rewrite each power in factored form and simplify.

9.  $2^3 \times 2^4 = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$        $2^7 = \underline{\hspace{2cm}}$

10.  $3^2 \times 3^3 = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$        $3^5 = \underline{\hspace{2cm}}$

11.  $5^2 \times 5^2 = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$        $5^4 = \underline{\hspace{2cm}}$

12. Describe the pattern demonstrated in problems 9-11. \_\_\_\_\_

\_\_\_\_\_

### THINK

Does this pattern work for other operations (addition, subtraction, or division) with exponents? Explain your reasoning with examples.
